## Root issue TAJO-1876

### 1.1 Summary

TaskImpl potentially may miss some TableDesc if they are duplicated.

### 1.2 Description

See TaskImpl::updateDescsForScanNodes. A plan part can include duplicated canonical names if derived subqueries are included in the plan part.

```
1 private void updateDescsForScanNodes(NodeType nodeType) {  
2     assert nodeType == NodeType.SCAN || nodeType == NodeType.PARTITIONS_SCAN || nodeType  
3         == NodeType.INDEX_SCAN;  
4     LogicalNode[] scanNodes = PlannerUtil.findAllNodes(plan, nodeType);  
5     if (scanNodes != null) {  
6         for (LogicalNode node : scanNodes) {  
7             ScanNode scanNode = (ScanNode) node;  
8             descs.put(scanNode.getCanonicalName(), scanNode.getTableDesc());  
9         }  
10    }
```
