List: [dev@tajo.apache.org](#)

Hi, guys

Nowadays, I and Hyunsik implemented a temporal web interface for the demonstration in IEEE ICDE.

The key characteristic is the visualization of the distributed query plan. During the implementation of the global query planner, I and Hyunsik had horrible experience to check whether the master plan (global plan) is correct or not.

I think that this implementation has some benefits for Tajo development such as monitoring, debugging, and so on.

I attached some screenshots of it.

The following query is used for the test.

```
select l_orderkey, o_orderdate from orders, lineitem where l_orderkey = o_orderkey and o_orderdate < '1995-03-15' and l_shipdate > '1995-03-15' order by o_orderdate
```

I'd like to listen to your opinions.

Thanks,
Jihoon

The mailing list seems not to support attached files. Could you upload the figures again in a different way?

Ohh I think I like the logo you guys putting there =)

We could probably adapt it to be official Apache Tajo logo.

Hi Henry,

The logo was created by my supervisor's wife 1 year ago. That logo was included in the paper submitted in August 2012.

However, I have never thought the logo will be the official one of Apache Tajo. I want more elegant one :) In addition, if we choose some logo, I would like to use the voting system.

Hi Hyunsik,

Yeah, elegant one always nice, definitely wont mind =)

Thanks for your comments!

Now, I'm attending the IEEE ICDE with Hyunsik.
I'm going to issue this proposal on Jira after going back to Korea.

Thanks,
Jihoon

Yes its really great work. Looking forward to it. I am so swamped right now and so stoked to dig into this code!

Hi Jihoon and Hyunsik,

+1. Maybe use a JIRA Issue?

<http://issues.apache.org/jira/browse/TAJO>

Cheers,
Chris
